Research Activity

Keywords: *Machine learning, clustering, fuzzy logic, neural networks, evolutionary algorithms, high dimensional data, big data, well-being technologies.*

In the last 30 years my research has been focused on the development of new methods of machine learning and computational intelligence (neural networks, fuzzy logic and evolutionary algorithms) and their applications, in particular to the analysis of high dimensional data in Bioinformatics in the frame of several collaborations with prestigious biomedical institutions, including the Sbarro Institute for Cancer Research and Molecular Medicine of Temple University (Philadelphia, PA-USA), the IST-Istituto Nazionale per la Ricerca sul Cancro (Genoa, Italy), and the University Joseph Fourier Grenoble 1 (France). In the last 5 years I started a new activity research on Well-Being Technologies, aimed to design systems supporting mental and physical well-being based on synergistic usage of and (wearable) consumer-electronics sensors data, computational intelligence large data analysis, and gamification approaches.

Main results I achieved:

- Clustering algorithms:
 - A method integrating the Deterministic Annealing

clustering method and some heuristics for cluster aggregation/dissolution and its application to the analysis of the activity of populations of biological neurons.

- Study of fuzzy possibilistic clustering algorithms and their applications to the segmentation of multimodal medical images, and to the recognition of ring structures of points immersed in strong noise (for application on the recognition of Cherenkov tracks for the LHCb experiment of CERN).
- A model called Graded Possibilistic Clustering based on the paradigm of intervals that unifies the probabilistic and possibilistic approaches to fuzzy clustering. The proposed algorithm can accurately model the membership functions, filter outliers and find the optimal number of clusters.
- A new approach to hierarchical clustering for large data dimensionality and low cardinality called Shared Farthest Neighbor Approach.
- A new definition of fuzzy ranking and its application to vector quantization and hierarchical clustering.
- A new kernel fuzzy clustering algorithm, called One-Cluster Possibilistic C-Means in Feature Space, based on the application of the algorithm of possibilistic fuzzy C-Means in the space induced by a kernel. The proposed algorithm preserves the properties of the original algorithm and can model the shape of the data density of a non-parametric way. This algorithm can be regarded as a generalization of the classical One-Class SVM algorithm.
- Other topics of machine learning and computational intelligence:
 - A neuro-fuzzy classifier supervised classifier approximating the optimal Bayes in the limit of large numbers of examples, and able to learn its parameters exploiting the numerical knowledge available in form of a set of examples. Before learning the classifier can be structured using the linguistic knowledge available on the classification problem expressed as fuzzy rules.
 - A serial ensemble of learning machines incorporating a neuro-fuzzy classifier with a local classical rule based on the Nearest Neighbor rule. The proposed ensemble shows an overall generalization better than those of its component classifiers.
 - A supervised classifier based on a decompositive ensemble, called Parallel Non-Linear Dichotomizers (PND) using a set of multi-layer perceptrons as dichotomizers.
 - Several models of learning machines for time series prediction. The latter model approaches the estimation of the tide in the lagoon of Venice, and is based on a input selection method using fuzzy sets and on ensemble learning methods involving Bagging or Adaboost.
- Applications of machine learning and computational intelligence in bioinformatics:
 - Algorithms for class discovering employing clustering methods for data at high dimensionality and low cardinality based on fuzzy ranking and on the Shared Farthest Neighbor approach to hierarchical clustering
 - Algorithms for biomarker selection techniques employing input selection, either through an ensembling technique

- integrating the local relevance of the input variables, or through the application of simulated annealing.
- An algorithm for co-clustering (biclustering) based on an extension of fuzzy possibilistic clustering algorithms. Biclustering algorithms cluster data and features at the same time. When applied to DNA microarray data, biclustering algorithms allow us to treat various biological problems including the identification of co-regulated genes, the extension of the functional annotation of genes, and the tissue classification. The proposed algorithm finds very large and homogeneous biclusters.
 - An algorithm for the prediction of target genes of specific microRNAs (miRNAs) that has been optimized to match biological knowledge through the application of genetic algorithms (machine learning algorithms inspired to biological evolution). microRNAs are a class of short noncoding RNAs that negatively control the expression of hundreds mRNA targets. Human miRNAs play key roles in differentiation, proliferation, cell death, neurogenesis and synaptic function and are deregulated in various diseases, such as prostate cancer, lung cancer, breast cancer, and colorectal cancer. The proposed method is more selective than state of art programs (e.g., miRanda) and may be used to guide biological experimental validation in a more focused direction. The present application domains are prostate cancer and neurogenesis.
 - A decision support system based on neuro-fuzzy methods for the design and analysis of oligonucleotide microarray for the Human Leukocyte Antigens (HLA) system typing, which consists of three regions of the human genome and is important for the histological determination of the compatibility between donor and receiver in transplantation.
 - The fields where I applied the methods of machine learning and computational intelligence I proposed, include: (a) the segmentation of multivariate medical imaging (b) the disambiguation of natural language; (c) the analysis of electronic nose data; (d) the monitoring the operation of an electric/hybrid vehicle; (e) the handwriting recognition; (f) the morphological analysis and dating of documents in paleography.
